Note: This is a dummy case study of Khaadi.

Case Study: Why Khaadi Needs a Data Warehouse

Background

Khaadi is one of Pakistan's most popular fashion brands, with a strong retail presence across major cities and an expanding online store. Every day, thousands of transactions occur across multiple outlets, warehouses, and the e-commerce platform, generating a massive amount of sales, inventory, and customer data.

The Challenge

Although Khaadi collects vast amounts of data, it faces fragmentation and inconsistency:

- Each retail outlet maintains its own point-of-sale (POS) system.
- The online store runs separately, with different product codes and pricing.
- Sizes, colors, and product IDs often don't match across stores.
- Reports require manual data collection and are often delayed by days or weeks.

Because of this, senior management struggles to get a clear, unified picture of the business.

Real-World Example: The Eid Rush

During Eid season, demand peaks dramatically:

- In **Karachi**, medium-sized embroidered kurtas sold out within a week. Customers left disappointed and turned to competitors.
- In **Islamabad**, the same kurtas sat unsold in storerooms, eventually marked down at steep discounts after Eid.
- By the time Head Office received consolidated sales reports, the season was already over — and the opportunity to balance stock across cities was lost.

Consequences of Not Having a Data Warehouse

1. **Lost Revenue** → Karachi missed out on sales due to stockouts.

2. **Excess Inventory** → Islamabad carried unsold stock, leading to heavy discounting and reduced profits.
3. **Slow, Manual Reporting** → Management decisions were delayed until after the critical sales period.
4. **Missed Customer Insights** → Loyalty program customers weren't targeted with personalized Eid promotions because their data was scattered.
5. **Customer Dissatisfaction** → Shoppers began to doubt Khaadi's ability to meet demand reliably.

The Solution: Data Warehouse

Implementing a centralized Data Warehouse would:

- Give real-time visibility of sales and inventory across all outlets and online channels.
- Enable automatic reallocation of stock between cities before shortages occur.
- Support demand forecasting based on historical Eid and seasonal data.
- Provide customer-level insights to run targeted marketing campaigns.
- Empower executives with a single source of truth for faster, fact-based decision-making.

Key Lesson for Students

Khaadi's case shows that having data alone is not enough. Without a Data Warehouse, organizations remain data-rich but insight-poor. A well-designed Data Warehouse transforms scattered data into actionable intelligence, helping businesses like Khaadi serve customers better, boost revenues, and stay ahead of competitors.

"If you were Khaadi's Data Analyst, what Decision Queries would you build first once the Data Warehouse is in place?"
